Reported to Health Agency Patient Address: Not Available

2016-11-18 07:00 MST Syphilis EIA:

This patient tested POSITIVE by the Syphilis EIA screening test, which is consistent with a current or past syphilis infection, a non-venereal treponematosi s (e.g. tropically acquired yaws, pinta, or bejel) or a false-positive reaction. This test will be followed by a supplementary assay (Syphilis Inno-LIA), if not previously performed.

Consultation with an expert is recommended if the clinical history suggests a recent or current infection. For advice or to obtain prior syphilis history on your patient, call Alberta Health and Wellness STD Services at (780)735-1466 or 1(888)535-1466 (business hours only) and speak to the STI nurse.

2016-11-18 07:00 MST TPPA:

Test Sent: Treponema pallidum agglutination assay R

Reported to Health Agency Patient Address: Not Available

2016-11-18 07:00 MST Treponema pallidum agglutination assay:

Patients with reactive TPPA results should be referred to STI Centralized Services for further evaluation at 780-735-1466 or 1-888-535-1466 (business hours only).

A reactive treponemal test indicates past or present infection and usually remains reactive for life.

The Serodia TP.PA may be reactive in a small percentage (less than 1%) of normal or healthy persons; these false-positive results are often transient, their cause unknown. The Serodia TP.PA may be reactive in persons from areas where bejel, yaws or pinta was, or is, endemic.

Samples from patients with HIV, Leprosy, Toxoplasmosis, H pylori and drug addiction may react, on occasion causing false-positive or inconclusive results.
